Aims and Scope

Natural Hazards and Earth System Sciences (NHES) is an international and interdisciplinary journal for the publication of original research concerning natural hazards. New perspectives for the understanding and tackling of natural hazards will arise by considering the subject from a broad base where the separate geosciences merge. NHES serves the community of geoscientists concerned with natural hazards and also those interested in publishing communications regarding interdisciplinary problems arising from difficulties encountered in the tackling of the mitigation of risks associated with natural hazards.
